

Assessment: Assignments 02

Student Name: Lin Chen (student num:041053912)

Lab Professor Name: Gustavo Adami

Lab Section Number: *314*

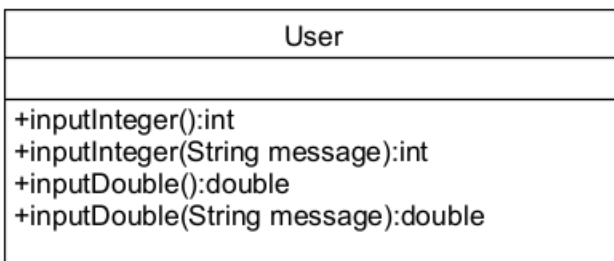

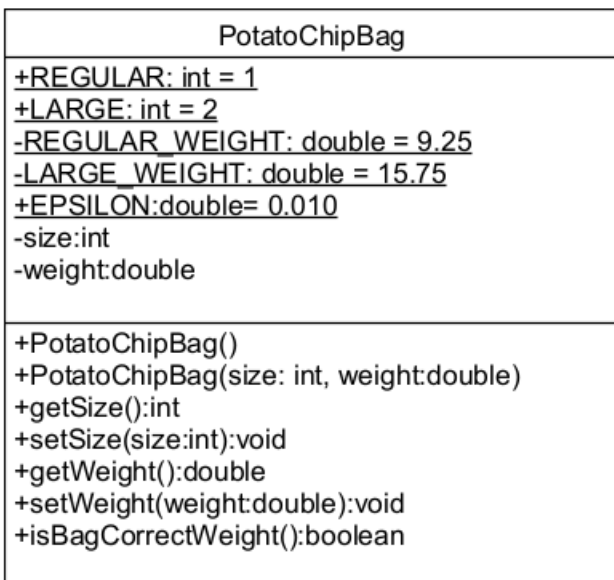

Due Date: Friday, July 29

Part 1 Understand the Problem

The program needs to input the size and weight of the potato chip bags and code a method by using Boolean to compare if within 0.01 oz or not to get the good bag or bad bag, using math method to calculate the difference (absolute value). Use loop(do,while) methods to verify the quality of the bags and calculate the total count of the bags.

Part 2 UML, Pseudocode and flow-charts

1) UML

UML Class Diagram by
Lin Chen
Assignment 02 (22S)
UML Class Diagrams

method main
is static so it is underlined
in UML.

2) Pseudocode for the method of Boolean isBagCorrectWeight()

```
//verify()
Declarations
    num size
    num weight
    num difference1
    num difference2
    Boolean result

result = false
difference1 = absolute value of (weight-REGULAR_WEIGHT)
difference2 = absolute value of (weight-LARGE_WEIGHT)
    if size = 1
        if difference1 <= EPSILON
            result = true;
    else if size = 2
        if difference2 <= EPSILON
            result = true;

    endif
return result
```

3) Pseudocode for the mian method

```
//main(String[] args)
Start
    Declarations
        PotatoChipBag bag
        User user
        num size
        num weight
        num goodBags=0
        num badBags=0
        num totalBags=0
        String value

    do
        output"Enter bag size: "
        output"1 for regular size"
        output"2 for large size"
        keyboard input size
        bag.setSize(size)

        if size = 1 or size = 2
            keyboard input weight
```

```

        bag.setWeight(weight)

        Boolean bagreturn = bag.isBagCorrectWeight()
        If bagreturn = true
            output"Good bags: " + (goodBags + 1)
            output"Bad bags: " + badBags
            output"Total bags: " + (totalBags + 1)
        else
            output"Good bags: " + goodBags
            output"Bad bags: " + (badBags + 1)
            output"Total bags: " + (totalBags + 1)
        endif
    else output"Invalid bag size entered"
    endif

    output"Program by Lin Chen"
    output"Continue Program?(yes/no)"
    keyboard input value

    while value = "yes"

        output"Program has shut down"

    Stop

```

4) Flowchart for the method of Boolean isBagCorrectWeight()

5) Flowchart for the mian method

Part 3 Test Algorithm with Simple Inputs

Table 1: Test Plan for method main for the repetition structure logic (looping tests)

Input	Expected Output	Actual Output	Description
1 9.25 yes	Good Bag: 1 Bad Bag: 0 Total Bags: 1 Continue? (yes/no) Enter Bag Size: 1 for regular size 2 for large size	Good Bag: 1 Bad Bag: 0 Total Bags: 1 Continue? (yes/no) Enter Bag Size: 1 for regular size 2 for large size	test passes, and the program continues.

2 10.00 YES	Good Bag: 1 Bad Bag: 1 Total Bags: 2 Continue? (yes/no) Enter Bag Size: 1 for regular size 2 for large size	Good Bag: 1 Bad Bag: 1 Total Bags: 2 Continue? (yes/no) Enter Bag Size: 1 for regular size 2 for large size	test passes, and the program continues.
1 9.24 no	Good Bag: 2 Bad Bag: 1 Total Bags: 3 Continue? (yes/no) Program has shut down	Good Bag: 2 Bad Bag: 1 Total Bags: 3 Continue? (yes/no) Program has shut down	test passes, and the program shuts down.
1 9.25 carrot	Good Bag: 1 Bad Bag: 0 Total Bags: 1 Continue? (yes/no) Program has shut down	Good Bag: 1 Bad Bag: 0 Total Bags: 1 Continue? (yes/no) Program has shut down	The program shuts down.

Table 2: Test Plan for method main for good chip bag, bad chip bag, total bags

Input	Expected output	Actual output	Description
1 9.25 No	Good Bag: 1 Bad Bag: 0 Total Bags: 1	Good Bag: 1 Bad Bag: 0 Total Bags: 1	Matches, one good bag, correct report, program exits.
1 9.25 yes 2 16.75 NO	Good Bag: 1 Bad Bag: 0 Total Bags: 1 Good Bag: 1 Bad Bag: 1 Total Bags: 2	Good Bag: 1 Bad Bag: 0 Total Bags: 1 Good Bag: 1 Bad Bag: 1 Total Bags: 2	Matches, one good bag, one bad bag, correct report, program exits
3 yes 1 10.00	Invalid bag size entered Good Bag: 0 Bad Bag: 1 Total Bags: 1	Invalid bag size entered Good Bag: 0 Bad Bag: 1 Total Bags: 1	Matches, invalid bag size entered, one bad bag input, program exits

Table 3: Test Plan for method isBagCorrectWeight()

Field values	Expected return value	Actual return value	Description
Size=1 Weight=9.24	true	true	Matches
Size=1 Weight=9.25	true	true	Matches
Size=1 Weight=9.26	true	true	Matches
Size=2 Weight=15.74	true	true	Matches
Size=2 Weight=15.75	true	true	Matches
Size=2 Weight=15.76	true	true	Matches
Size=1 Weight=9.2399	false	false	Not matches
Size=1 Weight=9.2601	false	false	Not matches
Size=2 Weight=15.7399	false	false	Not matches
Size=2 Weight=15.7601	false	false	Not matches

Part 4 Translate the Algorithm into Java

DONE.

Part 5 Compile and Test Your Program

ories r <terminated> Assignment02 [Java Application] C:\AmazonCorretto\jdk11.0.15_9\bin\javaw.exe

```
Enter bag size:
  1 for regular size
  2 for Large size
1
Enter weight
9.25
Good bags: 1
Bad bags: 0
Total bags: 1
Program by Lin Chen
Continue Program? (yes/no)
yes
Enter bag size:
  1 for regular size
  2 for Large size
2
Enter weight
15.75
Good bags: 2
Bad bags: 0
Total bags: 2
Program by Lin Chen
Continue Program? (yes/no)
yes
```

```
Continue Program?(yes/no)
yes
Enter bag size:
  1 for regular size
  2 for Large size
42
Invalid bag size entered
Program by Lin Chen
Continue Program?(yes/no)
yes
Enter bag size:
  1 for regular size
  2 for Large size
1
Enter weight
15.74
Good bags: 2
Bad bags: 1
Total bags: 3
Program by Lin Chen
Continue Program?(yes/no)
no
Program has shut down
```

Console × History

<terminated> Assignment02 [Java Application] C:\AmazonCorretto

Enter bag size:

1 for regular size

2 for Large size

2

Enter weight

15.74

Good bags: 1

Bad bags: 0

Total bags: 1

Program by Lin Chen

Continue Program? (yes/no)
